

**IN THE SPECIFICATION**

Please replace the paragraph beginning at page 7, line 21 with the following rewritten paragraph:

-- When GPC3 is cleaved at a cleavage site, the GPC3 is cut into a peptide of about 40 kDa and a peptide of about 30 kDa, which are on the N-terminal side and the C-terminal side, respectively. The cleavage site of GPC3 is the amino acid ~~reside~~ residue 358, the amino acid residue 374 or a region in the vicinity thereof. The main cleavage site is believed to be the amino acid residue 358. --
